Annual Report on Air Quality at Shahid Matangini Hazra Government General Degree College for Women WBPCB Pollution Monitoring Station 2023

1. Introduction

1.1 What is AQI?

AQI stands for Air Quality Index. It is a numerical scale used to communicate how polluted the air currently is and what associated health effects might be of concern. AQI typically ranges from 0 to 500, with lower values indicating better air quality and higher values indicating worse air quality.

Air quality can vary significantly from one location to another, influenced by factors such as proximity to pollution sources (e.g., industrial facilities, traffic congestion), terrain, weather patterns, and atmospheric conditions. Air quality can also fluctuate throughout the day and across seasons due to changes in emissions, weather patterns, and atmospheric conditions.

1.2 Constituents of AQI: The Air Pollutants

The AQI takes into account several common air pollutants, including:

- (a) Particulate Matter (PM₁₀ and PM_{2.5})
- (b) Ground-level Ozone (O₃)
- (c) Nitrogen Dioxide (NO₂)
- (d) Sulphur Dioxide (SO₂)
- (e) Carbon Monoxide (CO)

Each pollutant has its own concentration range corresponding to different AQI categories such as Good, Moderate, Unhealthy, Very Unhealthy, and Hazardous. The AQI provides a simplified way for the general public to understand the quality of the air they breathe and take appropriate actions to protect their health, such as limiting outdoor activities or wearing masks.

1.3 Monitoring AQI in India: CPCB and State PCBs (WBPCB)

In India, the Central Pollution Control Board (CPCB) is responsible for monitoring and regulating air quality at the national level, while State Pollution Control Boards (SPCBs) oversee air quality management at the state level. Each state has its own SPCB.

For example, in West Bengal, the State Pollution Control Board is known as the West Bengal Pollution Control Board (WBPCB). WBPCB, like other SPCBs, monitors air quality in its respective state and takes measures to control pollution levels.

These agencies typically measure various pollutants in the air using monitoring stations located across different regions. Data collected from these stations is then used to

calculate the Air Quality Index (AQI) for different areas. This information is often made available to the public through websites, mobile apps, and other communication channels, enabling individuals to stay informed about the quality of the air they breathe and take necessary precautions when air quality levels are poor.

1.4 Measuring AQI in India: CPCB Standards and Monitoring Station Network

The Central Pollution Control Board (CPCB) in India sets standards and guidelines for measuring Air Quality Index (AQI) across the country. These standards are based on the concentration levels of various pollutants in the air, including particulate matter (PM₁₀ and PM_{2.5}), nitrogen dioxide (NO₂), sulphur dioxide (SO₂), carbon monoxide (CO), ozone (O₃), and others.

CPCB operates a network of monitoring stations across different regions of India to measure air quality parameters. These monitoring stations collect real-time data on pollutant concentrations, which are then used to calculate the AQI for specific locations. The data collected from these monitoring stations are crucial for assessing air quality trends, identifying pollution hotspots, and formulating strategies to mitigate air pollution.

The CPCB has also established National Ambient Air Quality Standards (NAAQS) to ensure that the air quality in India meets the desired health and environmental objectives. These standards provide guidelines for permissible limits of various pollutants in the air and serve as a benchmark for assessing air quality across the country.

Additionally, CPCB collaborates with State Pollution Control Boards (SPCBs) and other agencies to coordinate air quality monitoring efforts at the state and local levels. Together, they work towards improving air quality management practices, implementing pollution control measures, and raising public awareness about the importance of clean air for health and well-being.

2. Geographical Setting of the Air Quality Monitoring Station

The AQI station is located at Shahid Matangini Hazra Government General Degree College for Women (22.2706090° N, 87.8957210° E), Kulberia-Chakshrikrishnapur village, Purba Medipur district, West Bengal and it falls under the jurisdiction of the Tamluk subdivision. In fact the college is located at the district headquarter premises very close to the NH-116 (Kolaghat-Haldia port connecting highway; previously NH 41). The station is situated 35 km north from the Haldia port and 5 km west from Tamluk town (adjacent to Rupnarayan River; Figure 1). The station is established and maintained by WBPCB in collaboration with the college.

The topography of the surrounding region typically it is characterized by flat or gently rolling terrain. The region is predominantly rural, with agricultural fields, ponds, and small water bodies dotting the landscape. But in last five years massive urban growth is observed as the district headquarters have shifted in this locality.

The area experiences a tropical climate, typical of the coastal regions of West Bengal. This means hot and humid summers, moderate to heavy rainfall during the monsoon season, and relatively mild winters. Following IMD for annual seasons can be observed: winter

(January and February), Pre-Monsoon (March to May), Monsoon (June to September), and Post-Monsoon (October to December).

Figure 1: Location of the WBPCB Air Quality Monitoring Station at Shahid Matangini Hazra Government General Degree College for Women

The vegetation in its vicinity includes a mix of cultivated crops, such as rice, jute, vegetables, and fruits, as well as natural vegetation like grasslands and shrubs.

The area is situated near or alongside small creeks that are part of the larger river systems in the region. These water bodies play a vital role in irrigation, fishing, and other livelihood activities.

3. Database and Methodology

The database was collected from open source daily data portal on air pollutants and AQI from West Bengal Pollution Control Board website (<https://aqmsdata.wbpcb.gov.in/>).

The large raw data set of comprising hourly data for each day a year are first grouped into classes following the breakpoints of AQI devised by Central Pollution Control Board of India (CPCB; Table 1).

Using this grouped data statistical analyses such as central tendencies like mean, median and mode and dispersion values like standard deviation are computed and plotted for monthly, seasonal and annual averages to find out the temporal variations in air quality during the year.

Different statistical diagrams are also drawn to find out the trends of concentrations of the individual pollutants and the AQI.

From the analysis above, findings are made that shows the health risks following the criteria devised by CPCB (Table 1).

Table 1: Breakpoints of AQI as devised by CPCB, India

AQI	Associated Health Impacts
Good (0–50)	Minimal Impact
Satisfactory (51–100)	May cause minor breathing discomfort to sensitive people
Moderate (101–200)	May cause breathing discomfort to the people with lung disease such as asthma and discomfort to people with heart disease, children and older adults
Poor (201–300)	May cause breathing discomfort to people on prolonged exposure and discomfort to people with heart disease with short exposure
Very Poor (301–400)	May cause respiratory illness to the people on prolonged exposure. Effect may be more pronounced in people with lung and heart diseases
Severe (401–500)	May cause respiratory effects even on healthy people and serious health impacts on people with lung/heart diseases. The health impacts may be experienced even during light physical activity

*Source: National Air Quality Index-Final Report, CPCB, 2015
[http://app.cpcbcr.com/ccr_docs/FINAL-REPORT_AQI_.pdf]*

A final report is produced with the results with detailed discussion on the probable health impacts. A poster with summary of the findings is also prepared, written in lucid language for easy understanding.

4. Results and Discussion

4.1 Annual trend for the year 2023

For the year 2023, a total of 8453 observations were made by the monitoring station. The annual average AQI was 114 (Table 2), indicating a moderate levels of pollution throughout the year (Figure 2; Annexure 1). Exposure to such level of air pollution may cause breathing discomfort to the people with lung disease such as asthma and discomfort to people with heart disease, children, and older adults. But most of the observations, i.e., 4561, fell under the satisfactory condition, which means the AQI value increased in specific periods. Upon inspection, it was found that extreme values of AQI (Very Poor and Severe; Table 3) were found mostly in the month of January and the day of Dipabali festival in November 2023. The highest value (418) occurred on January 3, 2023, at 3 p.m. The trends are well correlated with the seasons, while higher values are found in winter due to a stable atmosphere, monsoon months record lower values due to atmospheric instability and associated showers. Annexure 1 shows the details of every AQI observation during 2023.

4.2 Seasonal trends for the year 2023

As mentioned in Section 3, the year is divided into four IMD seasons, and seasonal trends of AQI variations were computed and analysed. It was observed that the air quality is deteriorating in winter and improving during the pre-monsoon and monsoon seasons (Tables 4 and 5; Figures 3 and 4). This trend is related to season-specific temperature, humidity, and air circulation patterns. In winter, due to low temperatures and humidity, the atmosphere remains stable with high pressure, and the air is mostly sinking from above, deterring the pollutant movement to the upper atmosphere. While in pre-monsoon (summer), with a rising temperature, the air nearer to the ground gets warm and rises to the upper atmosphere by convectional process, and the pollutants move to the upper atmosphere with the rising warm air, lowering the ground air pollution levels. With occasional storms in the pre-monsoons, pollutants come down with the rain. In monsoons, the pollution levels drop more with the continuous showers. Again, with the withdrawal of the monsoon and the lowering of the temperature, high pressure sets in and the ground air pollution level goes up.

Table 4: Seasonal frequencies of observations falling under different pollution level categories during the year 2023 at the SMHGGDCW monitoring station

Breakpoints	Status	YEAR 2023			
		Winter	Pre-Monsoon	Monsoon	Post-Monsoon
0-50	Good	0	7	321	297
51-100	Satisfactory	116	1381	2234	830
101-200	Moderate	689	788	220	730
201-300	Poor	299	34	28	174
301-400	Very Poor	293	0	0	10
401-500	Severe	2	0	0	0
Total Observations		1399	2210	2803	2041

Figure 4: Deviation trends of AQI values during the year 2023 at the SMHGGDCW monitoring station

Table 5: Statistical parameters of AQI for the seasons of year 2023 at the SMHGGDCW monitoring station

Parameters	YEAR 2023			
	WINTER	PRE-MONSOON	MONSOON	POST-MONSOON
Mean	207	104	27	111
Median	185	90	74	94
Mode	160	85	74	92
SD	88	40	60	64
Mean+1SD	296	145	86	175
Mean-1SD	119	64	-33	47

4.3 Monthly trends for the year 2023

The monthly averages show that the most polluted months are January, February, and November. The higher AQI values in January and February are related to the temperature and

pressure conditions, while the peak in November is due to burning crackers on the occasion of the Dipabali festival. The air quality improved in the second half of the year, with more readings recorded under the good and satisfactory air quality categories.

Table 6: Monthly frequencies of observations falling under different pollution level categories during the year 2023 at the SMHGGDCW monitoring station

Breakpoints	Status	MONTHS 2023											
		JAN	FEB	MAR	APR	MAY	JUN	JUL	AUG	SEP	OCT	NOV	DEC

Figure 6: Deviation trends of AQI values during the months of the year 2023 at the SMHGGDCW monitoring station

Table 7: Statistical parameters of AQI for the months of the year 2023 at the SMHGGDCW monitoring station

Parameters	MONTHS 2023					
	JAN	FEB	MAR	APR	MAY	JUN
Mean	259	151	115	120	82	86
Mean+1SD	343	201	158	161	106	113
Mean-1SD	175	101	73	80	59	59
Parameters	MONTHS 2023					
	JUL	AUG	SEP	OCT	NOV	DEC
Mean	75	77	63	92	145	92
Mean+1SD	78	159	115	143	207	149
Mean-1SD	72	-5	12	40	84	36

5. Summary and Conclusion

To summarise, the major outcomes of this analysis are:

(i) The average AQI is 114 for the year 2023, which suggests moderate levels of pollution throughout the year. Exposure to such levels of air pollution may cause breathing discomfort for people with lung diseases such as asthma and discomfort for people with heart disease, children, and older adults.

(ii) The AQI levels vary with the seasons. The colder months with high pressure conditions recorded a higher concentration of pollutants. Warm, rising air in the pre-monsoon and monsoon showers played an effective role in reducing air pollution.

(iii) January is the most polluted month, with an average AQI of 259, indicating poor to very poor air quality. Even two observations recorded severe pollution. It may cause critical health issues even for healthy people.

(iv) July, August, and September months are the least polluted due to the occurrence of monsoon rains.

(v) The second week of November shows a peak in AQI, i.e., correlated with the burning of crackers during the Dipabali festival.

The AQI aims to communicate potential health risks associated with different levels of air pollution. However, individual susceptibility to air pollutants can vary based on factors such as age, pre-existing health conditions, genetics, and lifestyle. Therefore, the AQI may not fully capture the diverse health impacts experienced by different population groups. Effectively communicating AQI information to the public, including its meaning, implications, and recommended actions, is essential for promoting awareness and behaviour change. However, conveying complex scientific concepts in a clear and understandable manner can be challenging, requiring effective communication strategies and outreach efforts.
